

# Cascading Style Sheets (CSS)

```
171 #content .article img.left.border {  
172     padding: 0 9px 9px 0;  
173     border-right: 1px dotted #999;  
174     border-bottom: 1px dotted #999; }  
175 #content .article blockquote {  
176     margin-left: 10px;  
177     padding-left: 10px;  
178     border-left: 3px solid #252525; }  
179 #content .article ul {  
180     padding-left: 1em;  
181     list-style-type: circle; }
```

Course Code:CIS121

Module Leader: Md. Rafiqul Huq Rafi

Lecturer (CIS),

Daffodil International University (DIU)

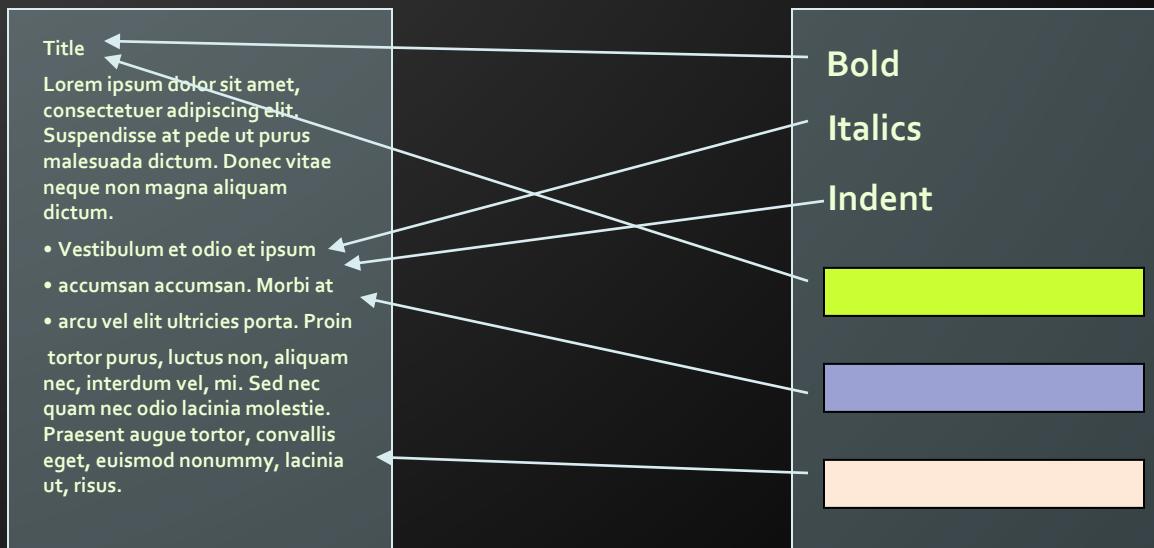

# Table of Contents

- ◆ What is CSS?
- ◆ Styling with Cascading Stylesheets (CSS)
- ◆ Selectors and style definitions
- ◆ Linking HTML and CSS
- ◆ Fonts, Backgrounds, Borders
- ◆ The Box Model
- ◆ Alignment, Z-Index, Margin, Padding
- ◆ Positioning and Floating Elements
- ◆ Visibility, Display, Overflow
- ◆ CSS Development Tools

# CSS: A New Philosophy

- ◆ Separate content from presentation!

Content  
(HTML document)      Presentation  
(CSS Document)

# The Resulting Page

## Title

**Consectetuer adipiscing elit.**  
**Suspendisse at pede ut purus**  
**malesuada dictum. Donec vitae neque**  
**non magna aliquam dictum.**

- *Vestibulum et odio et ipsum*
- *accumsan accumsan. Morbi at*
- *arcu vel elit ultricies porta. Proin*

**Tortor purus, luctus non, aliquam nec,**  
**interdum vel, mi. Sed nec quam nec**  
**odio lacinia molestie. Praesent augue**  
**tortor, convallis eget, euismod**  
**nonummy, lacinia ut, risus.**

# CSS Intro

## Styling with Cascading Stylesheets

# CSS Introduction

- ◆ Cascading Style Sheets (CSS)
  - ◆ Used to describe the presentation of documents
  - ◆ Define sizes, spacing, fonts, colors, layout, etc.
  - ◆ Improve content accessibility
  - ◆ Improve flexibility
- ◆ Designed to separate presentation from content
- ◆ Due to CSS, all HTML presentation tags and attributes are deprecated, e.g. font, center, etc.

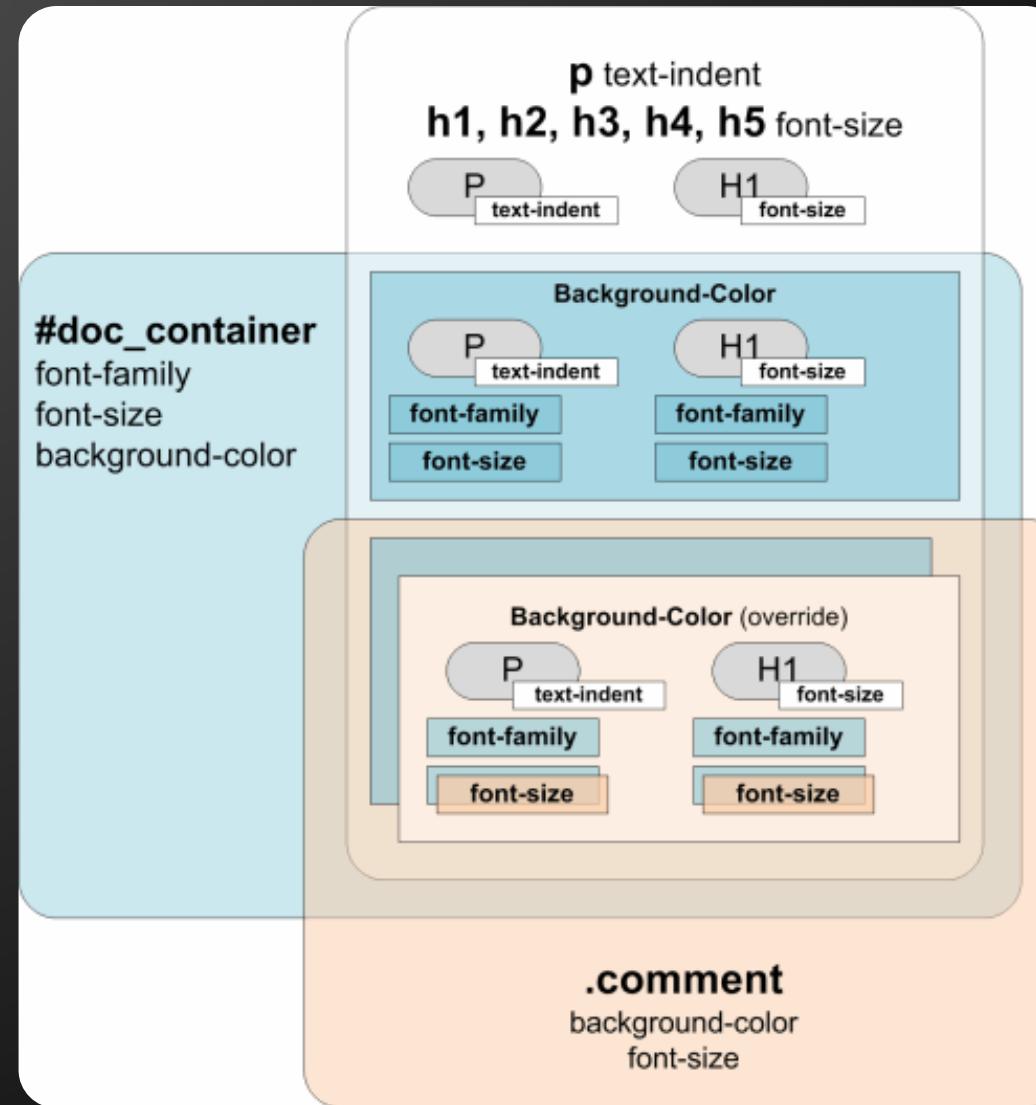

# CSS Introduction (2)

- ◆ CSS can be applied to any XML document
  - ◆ Not just to HTML / XHTML
- ◆ CSS can specify different styles for different media
  - ◆ On-screen
  - ◆ In print
  - ◆ Handheld, projection, etc.
  - ◆ ... even by voice or Braille-based reader

# Why “Cascading”?

- ◆ Priority scheme determining which style rules apply to element
- ◆ Cascade priorities or specificity (weight) are calculated and assigned to the rules
- ◆ Child elements in the HTML DOM tree inherit styles from their parent
  - ◆ Can override them
  - ◆ Control via !important rule

# Why “Cascading”? (2)

# CSS Cascade (Precedence)

- ◆ There are browser, user and author stylesheets with "normal" and "important" declarations
  - ◆ Browser styles (least priority)
  - ◆ Normal user styles
  - ◆ Normal author styles (external, in head, inline)
  - ◆ Important author styles
  - ◆ **Important user styles (max priority)**

```
a { color: red !important ; }
```

<http://www.slideshare.net/maxdesign/css-cascade-1658158>

# Why “Cascading”? (3)

- ◆ Some CSS styles are inherited and some not
  - ◆ Text-related and list-related properties are inherited - **color**, **font-size**, **font-family**, **line-height**, **text-align**, **list-style**, etc
  - ◆ Box-related and positioning styles are not inherited - **width**, **height**, **border**, **margin**, **padding**, **position**, **float**, etc
  - ◆ <a> elements do not inherit color and text-decoration

# Linking HTML and CSS

- ◆ HTML (content) and CSS (presentation) can be linked in three ways:

- ◆ **Inline:** the CSS rules in the `style` attribute
  - ◆ No selectors are needed
- ◆ **Embedded:** in the `<head>` in a `<style>` tag
- ◆ **External:** CSS rules in separate file (best)
  - ◆ Usually a file with `.css` extension
  - ◆ Linked via `<link rel="stylesheet" href=...>` tag or `@import` directive in embedded CSS block

# Linking HTML and CSS (2)

- ◆ Using external files is highly recommended
  - ◆ Simplifies the HTML document
  - ◆ Improves page load speed as the CSS file is cached

# Inline Styles: Example

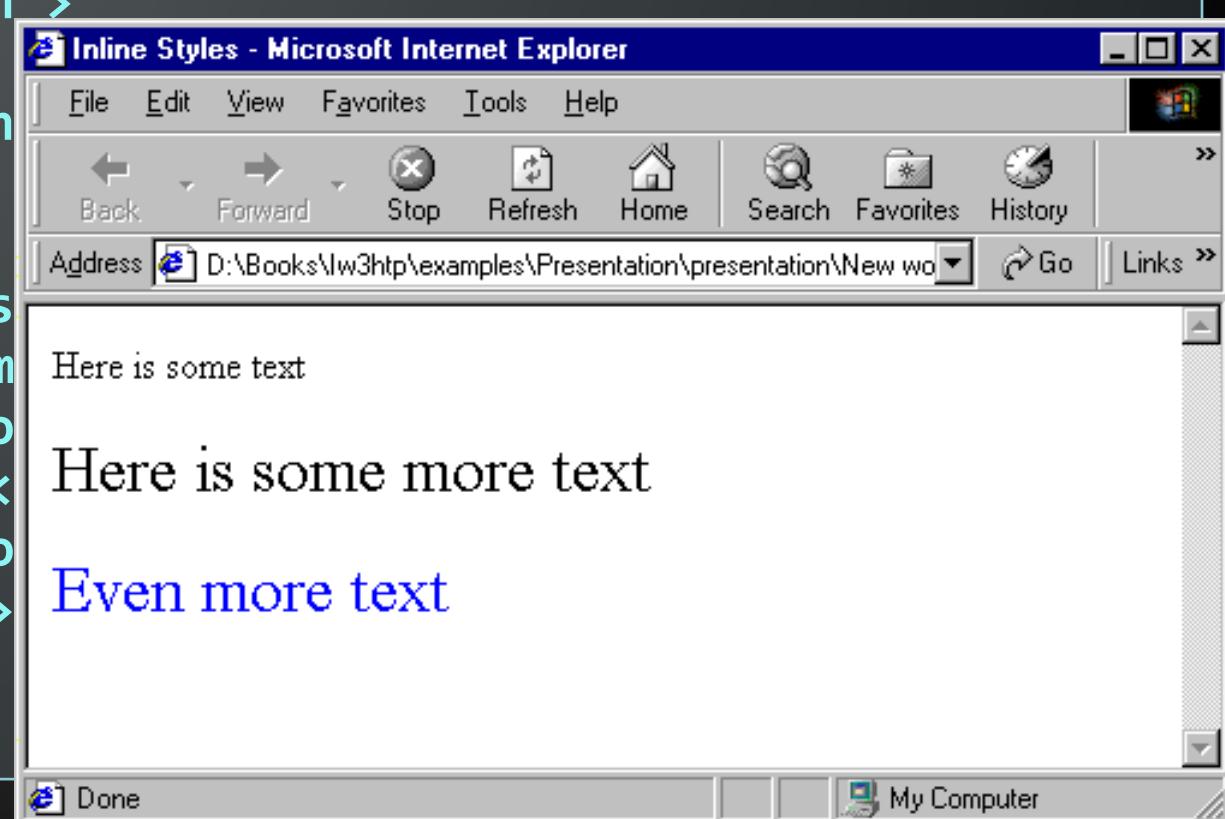

## inline-styles.html

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>Inline Styles</title>
</head>
<body>
  <p>Here is some text</p>
<!--Separate multiple styles with a semicolon-->
  <p style="font-size: 20pt">Here is some
    more text</p>
  <p style="font-size: 20pt; color:
    #0000FF" >Even more text</p>
</body>
</html>
```

# Inline Styles: Example

## inline-styles.html

```
<!DOCTYPE html>
<html lang="en">
<head>
    <title>Inlin
</head>
<body>
    <p>Here is s
<!--Separate m
    <p style="fo
        more text<
    <p style="fo
        #0000FF" >
</body>
</html>
```

# Embedded Styles

- ◆ Embedded in the HTML in the `<style>` tag:

```
<style>
```

- ◆ The `<style>` tag is placed in the `<head>` section of the document
- ◆ type attribute specifies the MIME type
  - ◆ MIME describes the format of the content
  - ◆ Other MIME types include `text/html`,  
`image/gif`, `text/javascript` ...
- ◆ Used for document-specific styles

# Embedded Styles: Example

## embedded-stylesheets.html

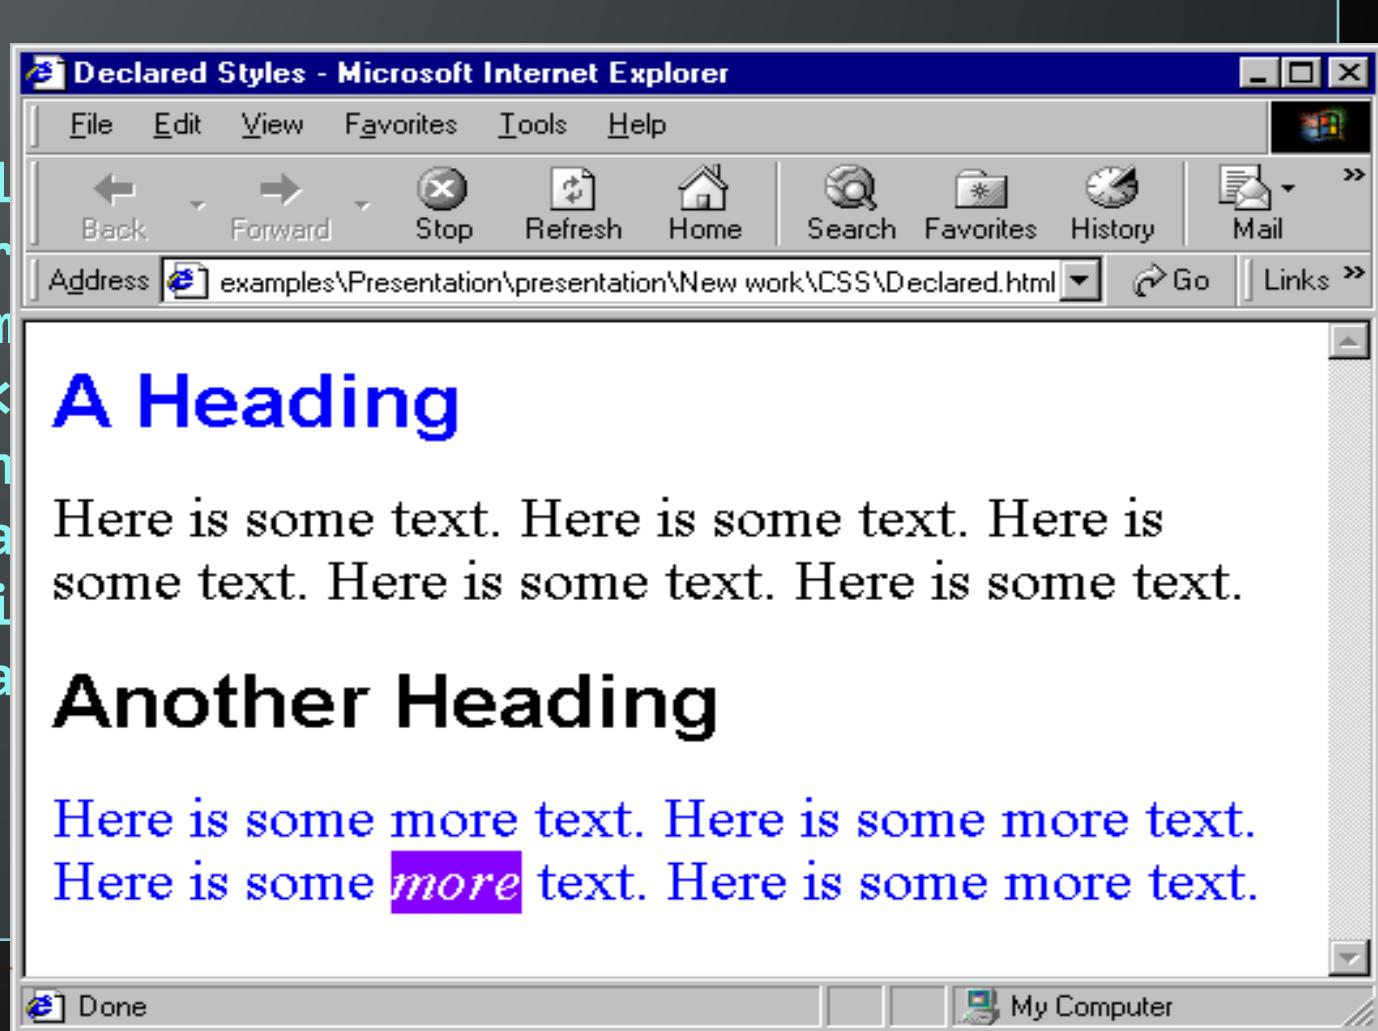

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>Style Sheets</title>
  <style type="text/css">
    em {background-color:#8000FF; color:white}
    h1 {font-family:Arial, sans-serif}
    p {font-size:18pt}
    .blue {color:blue}
  </style>
<head>
```

# Embedded Styles: Example (2)

```
...
<body>
  <h1 class="blue">A Heading</h1>
  <p>Here is some text. Here is some text. Here
  is some text. Here is some text. Here is some
  text.</p>
  <h1>Another Heading</h1>
  <p class="blue">Here is some more text.
  Here is some more text.</p>
  <p class="blue">Here is some <em>more</em>
  text. Here is some more text.</p>
</body>
</html>
```

# Embedded Styles: Example (3)

```
...  
<body>  
  <h1 class="big">A Heading</h1>  
  <p class="text">Here is some text.</p>  
  <h1>Another Heading</h1>  
  <p>Here is some more text. Here is some more text.  
     Here is some more text. Here is some more text.  
</body>  
</html>
```

# External CSS Styles

- ◆ External linking

- ◆ Separate pages can all use a shared style sheet
- ◆ Only modify a single file to change the styles across your entire Web site (see  
<http://www.csszengarden.com/>)

- ◆ link tag (with a rel attribute)

- ◆ Specifies a relationship between current document and another document

```
<link rel="stylesheet" type="text/css"  
      href="styles.css">
```

# External CSS Styles (2)

## @import

- ◆ Another way to link external CSS files
- ◆ Example:

```
<style>
  @import url("css/style.css");
  /* same as */
  @import "css/style.css";
</style>
```

- ◆ Ancient browsers do not recognize @import
- ◆ Use @import in an external CSS file to workaround the IE 32 CSS file limit

# External Styles: Example

## styles.css

```
/* CSS Document */

a { text-decoration: none }

a:hover { text-decoration: underline;
           color: red;
           background-color: #CCFFCC }

li em { color: red;
         font-weight: bold }

ul { margin-left: 2cm }

ul ul { text-decoration: underline;
          margin-left: .5cm }
```

# External Styles: Example (2)

## external-styles.html

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>Importing style sheets</title>
  <link type="text/css" rel="stylesheet"
    href="styles.css"  />
</head>
<body>
  <h1>Shopping list for <em>Monday</em>:</h1>
  <li>Milk</li>
  ...

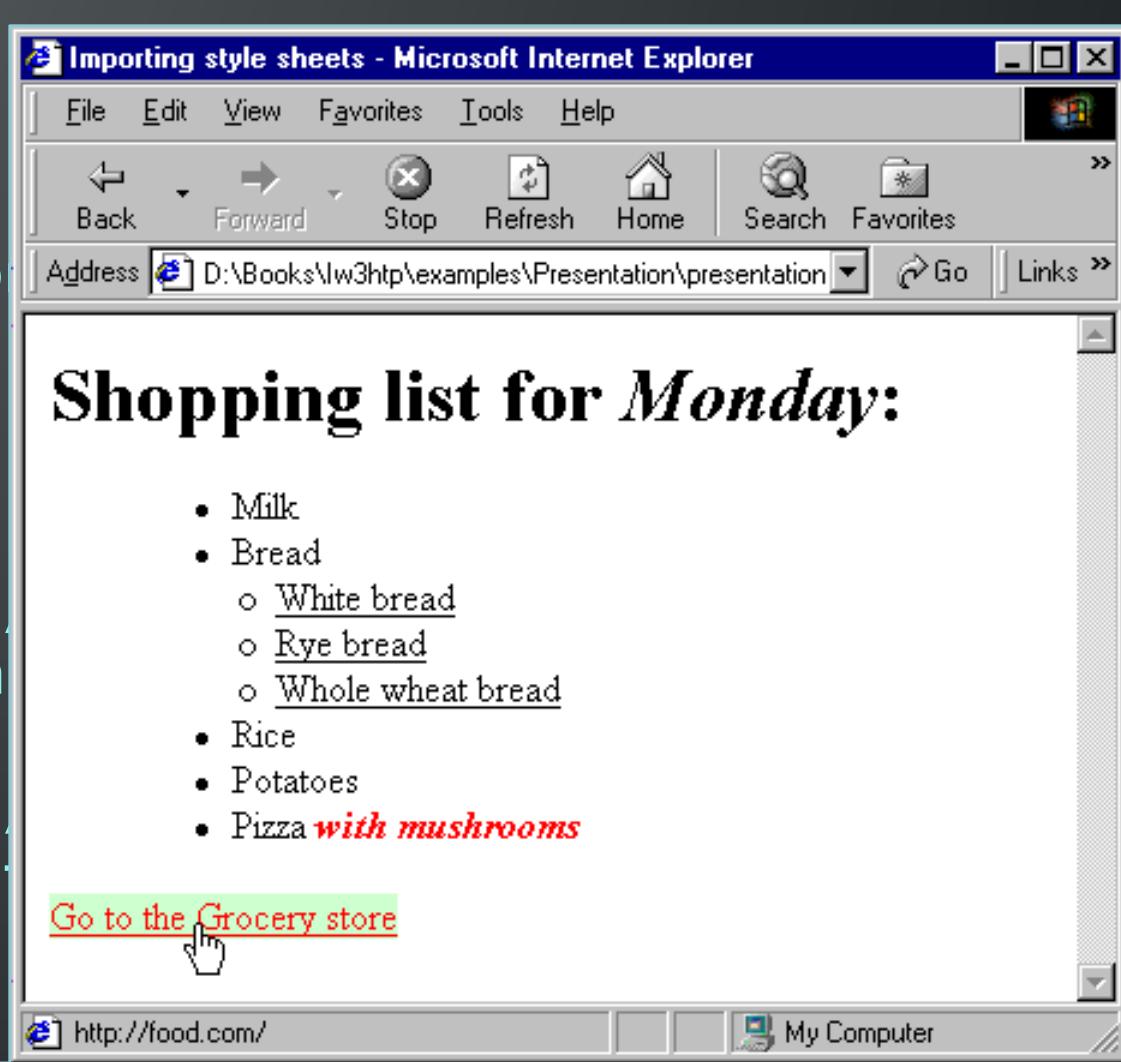

```

# External Styles: Example (3)

```
...
<li>Bread
  <ul>
    <li>White bread</li>
    <li>Rye bread</li>
    <li>Whole wheat bread</li>
  </ul>
</li>
<li>Rice</li>
<li>Potatoes</li>
<li>Pizza <em>with mushrooms</em></li>
</ul>
<a href="http://food.com" title="grocery
  store">Go to the Grocery store</a>
</body>
</html>
```

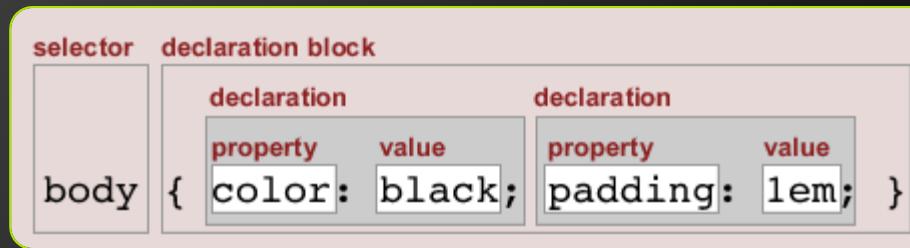

# External Styles: Example (4)

```
...
<li>Bread
  <ul>
    <li>White bread
    <li>Rye bread
    <li>Whole wheat bread
  </ul>
</li>
<li>Rice</li>
<li>Potatoes</li>
<li>Pizza <em>with mushrooms</em></li>
</ul>
<a href="http://www.food.com/grocery-store">Go to the grocery store</a>
</body>
</html>
```

# Style Sheets Syntax

- ◆ Stylesheets consist of rules, selectors, declarations, properties and values

<http://css.maxdesign.com.au/>

- ◆ Selectors are separated by commas
- ◆ Declarations are separated by semicolons
- ◆ Properties and values are separated by colons

```
h1,h2,h3 { color: green; font-weight: bold; }
```

# Values in the CSS Rules

- ◆ Colors are set in RGB format (decimal or hex):
  - ◆ Example: #a0a6aa = rgb(160, 166, 170)
- ◆ Numeric values are specified in:
  - ◆ Pixels, ems, e.g. 12px, 1.4em
  - ◆ Points, inches, centimeters, millimeters
    - ◆ E.g. 10pt, 1in, 1cm, 1mm
  - ◆ Percentages, e.g. 50%
    - ◆ Percentage of what?...
  - ◆ Zero can be used with no unit: border: 0;

# Default Browser Styles

- ◆ Browsers have default CSS styles
  - ◆ Used when there is no CSS information or any other style information in the document
- ◆ Caution: default styles differ in browsers
  - ◆ E.g. margins, paddings and font sizes differ most often and usually developers reset them

```
* { margin: 0; padding: 0; }
```

```
body, h1, p, ul, li { margin: 0; padding: 0; }
```
